

M20C Torque Transducer

rapidly changing torque in positive and negative polarity. The transducer has a built-in optoelectronic speed sensor.

The torque output signal can be digital (USB 2.0, RS232, RS485 (Modbus) interfaces), analogue (± 5 V, ± 10 V, 4 ... 20 mA) and frequency (10 kHz \pm 5 kHz, 60 kHz \pm 30 kHz). The M20C can be easily connected to a PC. The Windows-based software for data acquisition and its processing is included in the scope of supply with the M20C torque transducer.

The M20C is a rotating torque transducer of a flange type.

The M20C transducers are used to measure constant and variable torque at the wide measuring range from ± 3 up to $\pm 30\,000$ Nm and at the rotation speed up to 10 000 rpm.

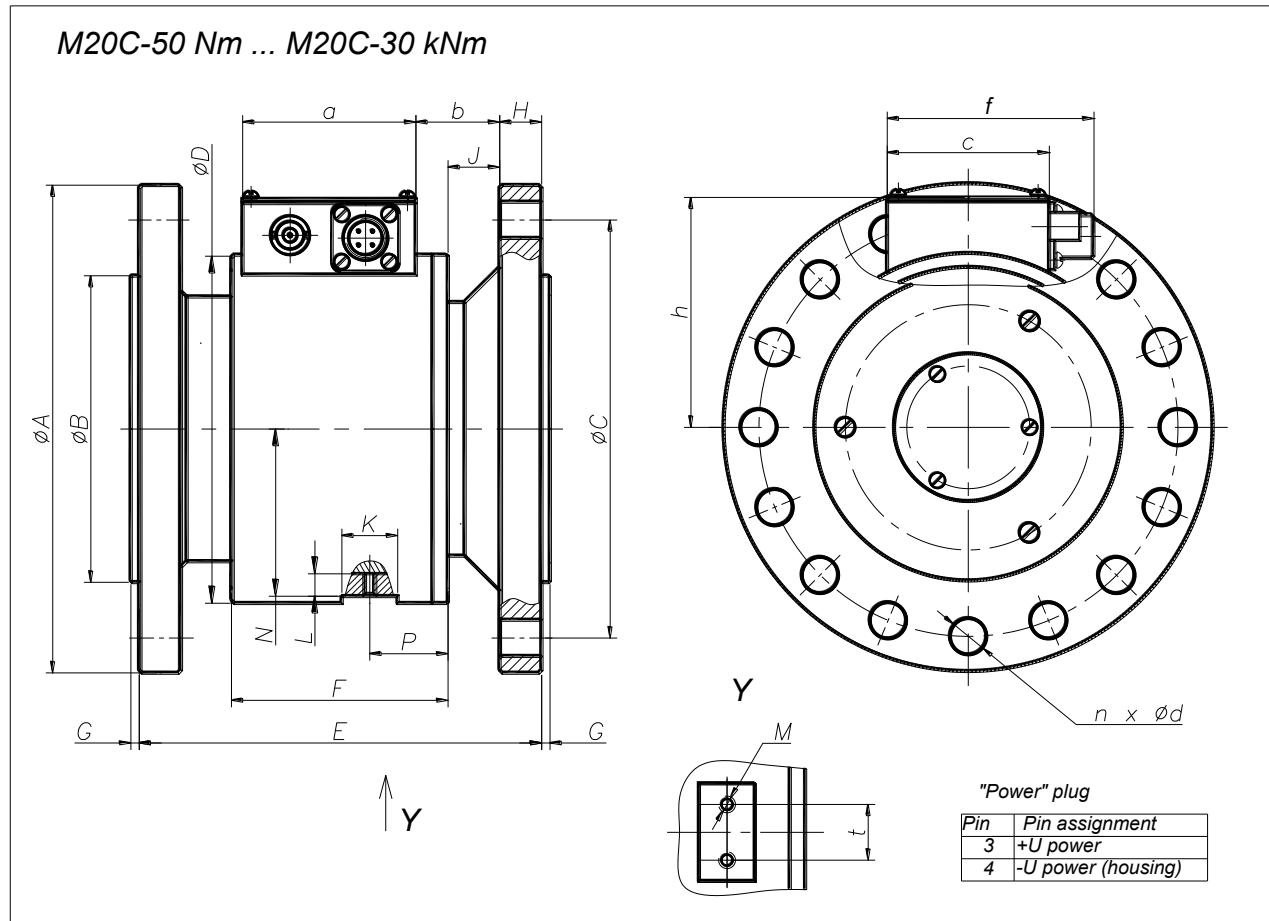

They represent a new generation of digital torque transducers with advanced performance. The M20C torque transducers are equipped with the advanced digital telemetry system for contactless transmission of the measured torque data from the rotor to the stator.

This digital coded signal has high interference immunity, provides high accuracy of measurements and can be transmitted over significant distances without distortion and loss of information.

The rotor is supported on the stator by ball bearings.

The M20C torque transducers are suitable to determine static as well dynamic

Axial force, radial force and bending moment have to be reduced according to graph 1, if they act together.

To prevent from excessive stress due to misalignment and thermal influences the transducer should be fitted between flexible couplings. We offer such flexible torsionally rigid couplings MK series. Technical specification see in the data sheet entitled "MK Couplings".

Software

The MS-Windows software for M20C transducer enables the acquisition of measurement data and its storage in a file. The measurements can be visualized on-line with digital indicators and x/y displays. A text file is provided for storage so that the measurement data can be read and processed by other programs.

The software provides auto identification of the type of transducer, serial number, measuring range.

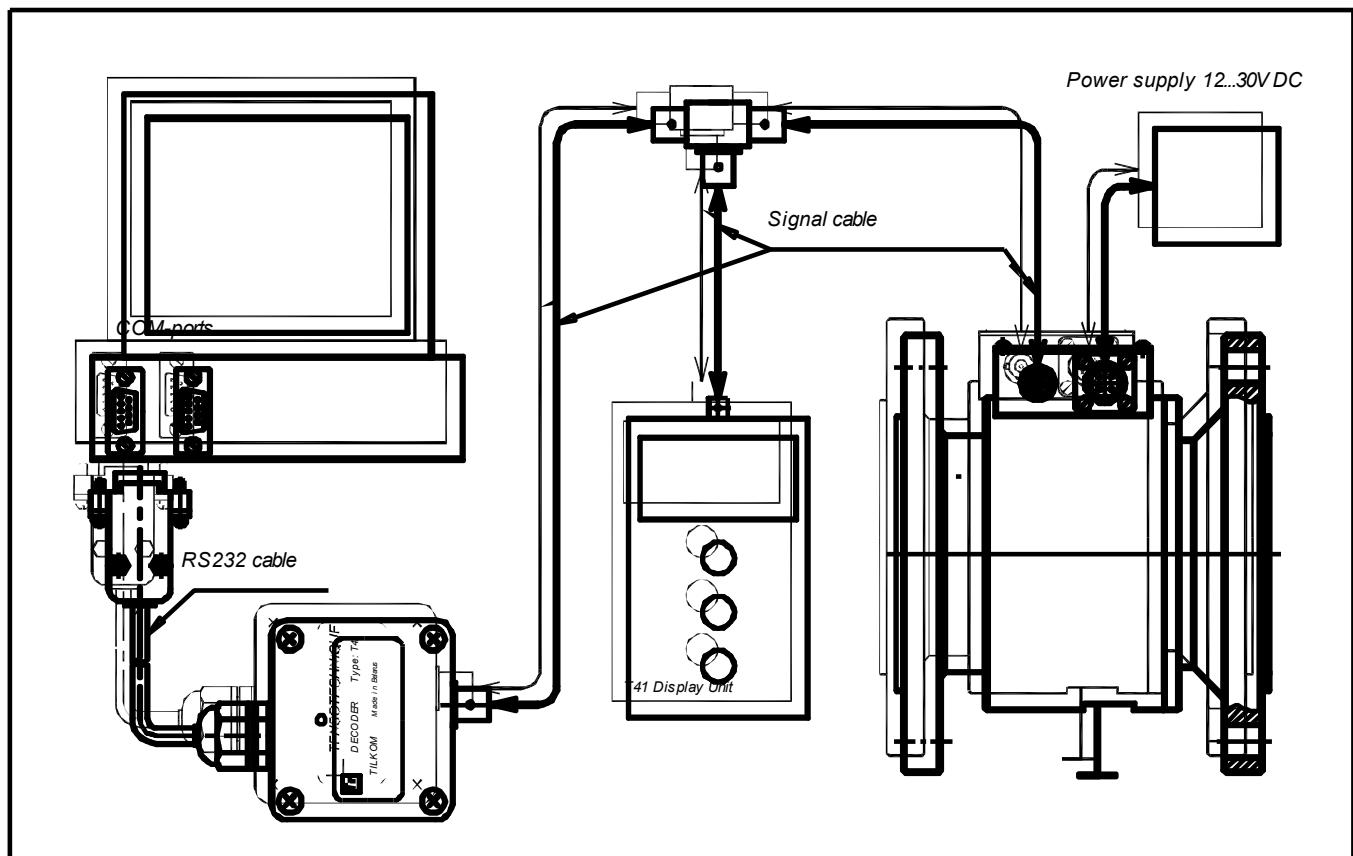

Features: support up to 8 (eight) transducers simultaneously, mathematical computation of mechanical power, rotation speed and torque, measurement signal filter and signal averaging, zero shift adjustment, fast records, slow records, scaling of x-axis and y-axis, digital indicator of high resolution, real-time display of measured values, their storage and playback. The software has a function of recording data without averaging at the maximum speed of receiving data; this enables you to analyze the dynamic processes.

Installation example

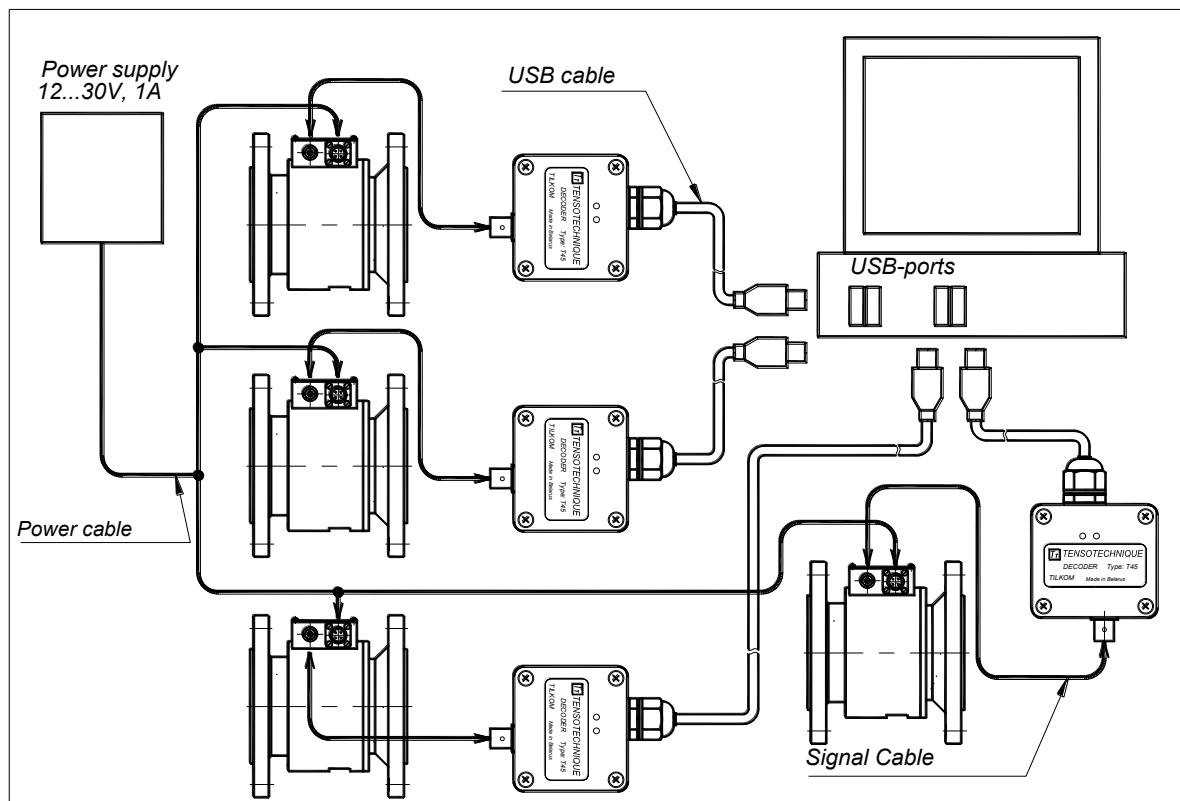

Electrical connections

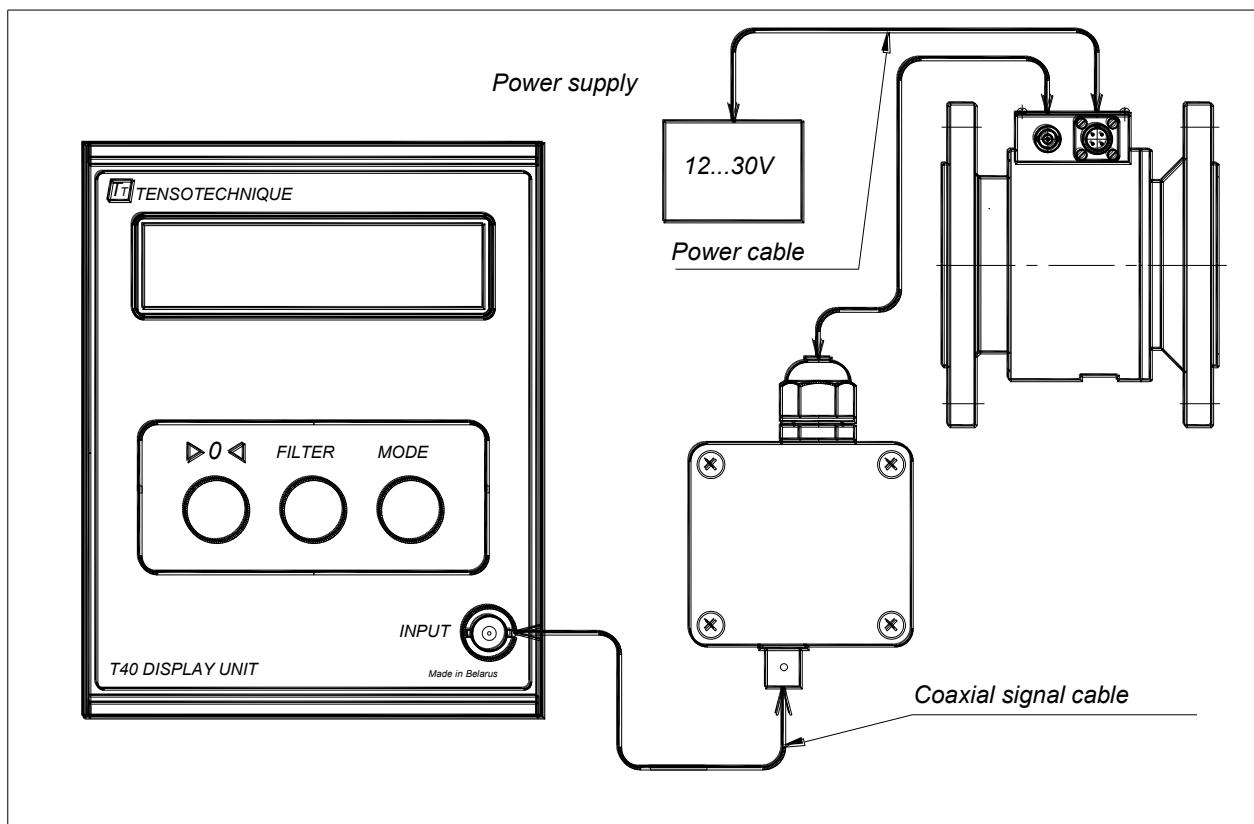

1. Simultaneous use of a PC and the T40 (T41) display unit

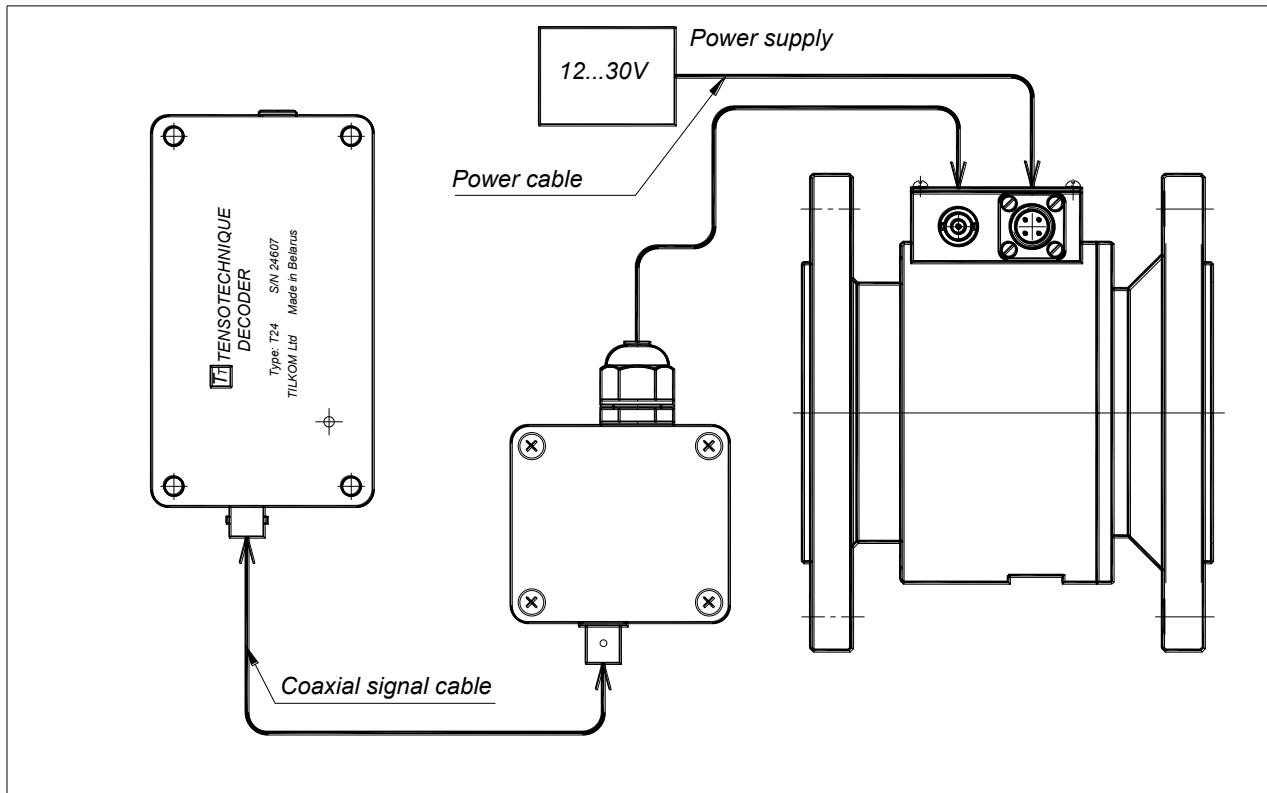

2. Connection to an USB-port (T45 decoder)

3. Connection to the T40 display unit

4. Connection to the T24 analogue decoder (± 5 V, ± 10 V or 4 ... 20 mA)

5. Connection to the T46 decoder (RS485)
